Why two ears are better than one
The advantages of wearing two hearing aids:

1. **Safety**
   When a person hears with only one ear, the difficulty in locating sound can be dangerous, especially in traffic.

2. **Wider hearing range**
   A voice barely heard at 3 metres with one ear can be heard up to 10 metres away with two ears.

3. **Both ears stay active**
   When a hearing impaired person wears a hearing aid in one ear, the unused ear tends to lose its ability to hear and understand.

4. **Superior sound identification**
   Noises, which sound almost exactly alike when heard with one ear, can be identified easily with two ears.

5. **Hearing from both sides**
   As nature intended, hearing with two ears enables you to participate in conversations on either side, allowing you to enjoy a more normal social life.

6. **Improved understanding**
   Binaural hearing helps you to understand individual voices with greater clarity.

7. **Restful listening**
   Listening with only one ear can be physically tiring and stressful.

8. **Cushions loud sounds**
   Sudden loud sounds lose much of their jarring effect when divided between two ears.

9. **Smother tone quality**
   Binaural hearing generally requires less volume, giving a natural sound to voices and music.

10. **Better hearing in background noise**
    Binaural hearing makes it easier to separate voices from background noise interference.
