BIRD REMOVAL & CONTROL

Are feral birds causing annoying problems and keep coming back? Don't worry. At Termitrust Pest Control we know birds so you don't have to.

Bird control is an extremely sensitive area of pest management however sometimes the problems caused by birds become a serious problem for homeowners and businesses.

Problems Associated with Birds

- Birds tend to roost and nest in all types of buildings, whatever the design. This is usually a seasonal occurrence when the breeding cycle commences.
- Bird droppings can deface buildings, walkways, air conditioning units, hand railings and other highly visible areas. This not only looks unattractive but also can contribute to health problems.
- Bird droppings harbour diseases such as Histoplasmosis, Cryptococcosis and Aspergillosis fungus. When the spores become airborne, they can be inhaled causing serious illness. Pigeons are the main offenders because of their roosting.
- Birds are hosts for bird lice and bird mites, and which can become a nuisance

A professional treatment by Termitrust is your best choice to reduce the presence of problem birds around your home or business. We are trained in bird biology, breeding habits and the latest methods for their removal or keeping them at bay.

Our technicians will explain all options and provide detail regarding all alternative methods applicable to your requirements.

The elimination of birds must be treated responsibly and with caution. Many preventative measures are available but each must be considered in terms of appropriateness for the specific situation.

Most importantly, we know birds in your local area. We have pest technicians on the ground in

Bird Removal Techniques

- *Bird Baiting*
This requires the pre feeding of birds for up to 14 consecutive days then on the final day an immobilizing agent is used to pacify the birds where they can be readily removed from the site.
- *Trapping*
This method must be carried out in a controlled environment where the birds cannot be disrupted by daily activities. Suitable feed is placed at the target area and gradually different cage components are introduced until the birds are comfortable with the cage. Once the birds have entered the cage, they will not be able to escape. The cage and birds are then removed.
- *Shooting*
Due to some bird species being classified as pests or vermin, it is legal to set up a culling program to alleviate an infestation. This procedure is considered as a final action when other options cannot be implemented.

Bird Prevention Methods

- *Bird Spikes*
These are installed along framework, walls, pipes and other items to prevent birds from roosting.
- *Bird Wire and Coils*
Similar to bird spikes preventing birds from roosting on wider ledges. This system can also be electrified to induce a shock.
- *Bird Netting*
Bird-proof netting is used to prevent birds from coming into unwanted areas.
- *Daddi Long Legs*
These are long, thick, wavy, stainless steel rods used in situations such as lights, air conditioning units and other flat surfaces.

Did you know pigeons...

- Do not migrate and stay near their birth site which may be your home or premises
- The can breed from 5 to 6 months and up to as old as 10 years of age
- Both parents feed their young milk
- They have been known to see very well over a 26 mile distance
- Beats its wings up to ten times per second, while maintaining a heart rate of 600 beats per minute up to 16 hours without rest
