

## Evaporative Cooling

Installing an evaporative cooling system is a great way to maintain a comfortable natural room temperature while keeping your home well ventilated. Evaporative cooling systems are generally comprised of specialised cooling pads, a water tank, pump and a ventilation motor which converts warm outside air into a refreshingly cool breeze.

There are many benefits to choosing an evaporative cooling system.

- The airflow can rid your home of allergens and asthma-causing particles
- Provides a complete ventilation solution, driving out odours and stale air
- Uses significantly less electricity than refrigerated air conditioning systems
