

Greenway Landscapes can help you with your drainage and irrigation needs. Watering systems can be attached to recycled water or rainwater supplies. Drip irrigation systems minimise the waste of water due to overflow run off and evaporation.

Irrigation systems can be controlled manually or installed to operate automatically. A rain sensor is a good idea to minimise wasting water. Irrigation systems can be divided into zones to enable you to control the amount and frequency that each area receives the water.

Storm water problems can be easily fixed by making sure that you have adequate drainage in your garden for collecting and distributing water flow. This helps minimise erosion as well as water damage to your garden and home.
