BEE & WASP CONTROL, REMOVAL & EXTERMINATION

Do you need to get rid of bees or wasps? Don't worry. At Termitrust we know pests so you don't have to.

Any swarm of bees or wasps around or home should be removed as quickly as possible. Both can establish new nests or hives very quickly and in large numbers.

A professional treatment by Termitrust is your best choice to get rid of bees or wasps around your home or garden.

Most importantly, we know bees and wasps in your area. We have pest technicians on the ground in the following key locations and other surrounding regions:

QLD - Brisbane, Gold Coast, Sunshine

Coast, Ipswich, Toowoomba, Cairns, Rockhampton & Mackay

NSW - Sydney, Central Coast, Newcastle, Hunter, Port Macquarie, Coffs Harbour & Dubbo

VIC - Melbourne

WA - Perth, Mandurah, Bunbury & South West

SA - Adelaide

Typical bees and wasps include:

- *Paper Wasp*

Native paper wasps are brownish with yellow markings although a few species have reddish markings. They have orange antennae and grow to 15 to 20 mm in length. They are found throughout Australia and in suburban areas. The paper wasp nest is a series of cells that looks like an inverted cone.

Paper wasps attack humans when their nest is disturbed. They deliver extremely painful stings. A severe reaction may occur if stings are multiple.

- *European Wasp*

A European wasp looks similar to a bee and is brown with yellow abdominal stripes.. They grow to between 18 to 38 mm in length. They live around homes because of the ready supply of food and water. They are especially attracted to sweet foods and drinks.

The European wasp can sting repeatedly and the stings are very painful. A European wasp sting causes burning pain, a raised lump, redness and local inflammation. Repeated stings may trigger an allergy, including life-threatening anaphylaxis.

- *European or Western Honeybee*

Australia's early European settlers introduced Honey Bees to ensure a good supply of honey. Honey Bees are one of the most recognisable insects. They are somewhat variable in colour but are usually brown with a banded dull yellow and brown abdomen.

Honey Bee stings are barbed and, when a person is stung, the sting (with venom gland attached) will stick in the skin and tear away from the bee. This injury kills the bee, but the venom gland continues to pump venom through the sting.

Did you know wasps...

- Recognise and remember each other's faces
- Social wasps live in nests inhabited by 5,000-10,000 wasps at one time
- Sleep and even hibernate for months while hanging by their teeth
- When a wasp dies it emits a pheromone in the air which acts as a warning signal to other wasps
