

## Split System Air Conditioning

Split system air conditioners give you best of both worlds - cooling your home in summer and heating it in winter. Split systems make use of an indoor component (a unit available in a range of types, including wall mounted, floor standing, ceiling cassette or bulk head) as well as an outdoor unit (attached via a refrigeration pipe), allowing for application and installation in difficult spots.

The benefits of split system air conditioners include:

- Allowing you to have maximum control over your rooms temperature.
- Automatic timing options (allowing you to determine when the split system will automatically turn on and switch off for different times, 7 days of the week, making them perfect for shift workers and busy lifestyles.)
- Very high energy efficiency
- Wi-Fi add ons allowing you to have your house at the perfect temperature before you even get home, all from your smart phone.
- Very quiet operation
- Low maintenance
- Rapid installation
